

# DYNA CYLINDERS

*Ultra-reliable, high-function tie-rod cylinder*

The DYNA cylinders, compact and lightweight mid-sized actuators compatible with ISO standards, offer a wide range of configurations and mounting types to meet various application requirements in a flexible manner. Moreover, the use of a new type of cushion needle and floating seal have made these products user-friendlier.

## Extensive variation of functions

- The series configuration together with its versatile functionality and specifications offers the best match for various mechanical devices.

## Improved cushioning

- Improved cushioning is gained by utilizing floating seal in the cushion section.

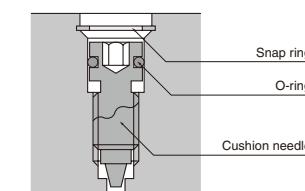

## Long life

- Oil impregnated sintered copper alloy in bushings enables stable operation and longer life.

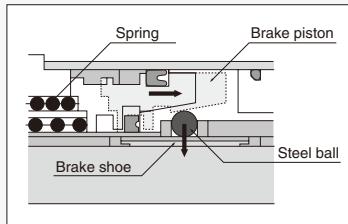

## New cushion needle

- Using a new type of cushion needle that is completely embedded in the cylinder body offers fine adjustment for better performance.

## Safe self-locking mechanism

- New release of cylinders with brakes. Exhausting compressed air pushes a brake shoe against the piston rod thereby stopping the cylinder.

※ Steel balls and a brake shoe are secured in position. Operating the brake piston enables activation or release of the brake.

## Handling Instructions and Precautions

### General precautions

#### Media

1. Use air for the media. For the use of any other media, consult us.
2. Air used for the DYNA cylinder should be clean air that contains no deteriorated compressor oil, water, dust, etc. Install an air filter (filtration of a minimum 40 µm) near the cylinder or valve to remove collected liquid or dust. In addition, drain the air filter periodically.

#### Piping

Always thoroughly blow off (use compressed air) the tubing before connecting it to the DYNA cylinder. Entering chips, sealing tape, rust, etc., generated during piping work could result in air leaks or other defective operation.

#### Atmosphere

If using in locations subject to dripping water, dripping oil, etc., or to large amounts of dust, use a cover to protect the unit.

#### Lubrication

This equipment can be used without lubrication. If lubrication is required, use Turbine Oil Class 1 (ISO VG32) or lithium soap-based grease No.2 or equivalent.

### Handling

#### Assembly of mounting bracket

Use mounting screws which are supplied with the bracket to assemble the mounting bracket. Use an Allen wrench to tighten the mounting screws evenly. When 4 screws are used, tighten diagonally from each corner. The tightening torque is shown below.

#### Assembly and disassembly

For disassembly, insert an Allen wrench to loosen the tie rod nut, and remove the cover.

For assembly, screw in the tie rod nut with the hexagon socket facing outward. Evenly tighten diagonally from each corner. The tightening torque is shown below.

## Handling Instructions and Precautions

### Manual operation of end keep cylinder locking mechanism

While the locking mechanism is normally released automatically through cylinder operations, it can also be released manually. For manual release, insert an M4×0.7 screw that has 30mm [1.18in.] screw length into the manual override opening, thread it in about 3 turns into the internal lock piston, and then pull up the screw. To maintain the manual override for adjustment, etc., thread the locknut onto the screw and, with the locking mechanism in a released state, tighten the locknut against the cylinder.

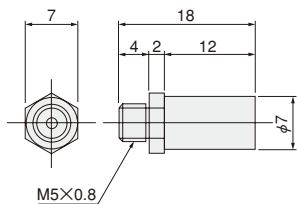

**Cautions:**

1. It is dangerous to release the lock when load (weight) is present on the piston rod, because it may cause the unintended piston rod's extension (or retraction). In this case, always supply air to the connection port opposite the one adjacent to the locking mechanism before releasing the locking mechanism.
2. If the locking mechanism cannot easily be released even with manual override, it could be the result of galling of the lock piston and piston rod. In this case, supply air to the connection port opposite the one adjacent to the locking mechanism before releasing the locking mechanism.
3. Because water, oil, dust, etc., intruding through the manual override opening may be a cause of defective locks or other erratic operation. If using in locations subject to dripping water, dripping oil, etc., or large amounts of dust, use a cover to protect the unit.
4. If the circuit cannot maintain exhaust pressure at 0.03MPa [4.4psi.] or less due to using a manifold valve, use individual valve for operations.

### Dedicated muffler

The dedicated muffler can be mounted on the manual override opening.

Dedicated muffler model **SA-5** (mm)

### Control circuit for the end keep cylinder

1. For control of the DYNA end keep cylinders, we recommend the use of 2-position, 4-, 5-port valves. Avoid the use of control circuit of ABR connections (exhaust centers) with 3-position valves that exhaust air from 2 ports.
2. Always use meter-out control for speed control. Meter-in control may result in failure of the locking mechanism to release.
3. Always set the air pressure to 0.15MPa [22psi.] or more.

**Cautions:** 1. It is dangerous to supply air to a connection port on a side with a locking mechanism while the cylinder has already been exhausted, because the piston rod may suddenly extend (or retract). In addition, since the lock piston could also cause galling of the lock piston and piston rod, resulting in defective operation. Always supply air to the connection port on the opposite side of the locking mechanism to ensure applying back pressure.

2. When restarting operations after air has been exhausted from the cylinder due to completion of operations or to an emergency stop, always start by supplying air to a connection port on the opposite side of the locking mechanism.
3. Connect the valve port A (NC) to the connection port on the side with the locking mechanism.

## Handling Instructions and Precautions

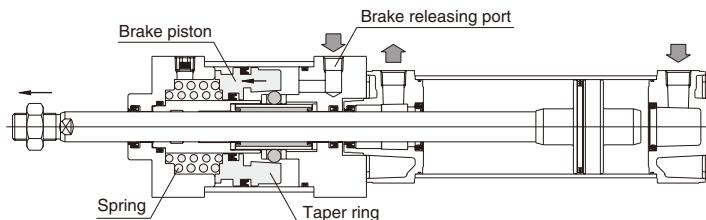

### Mounting and piping (for cylinder with brake)

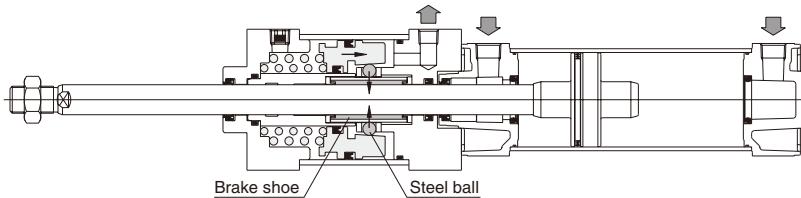

#### Operating principle

The cylinder with brake uses a mechanism that consists of steel balls contacting a incline and it receives components of a spring force, then it transmits the force via a brake shoe to apply to the piston rod.

#### ● When the brake is released

#### ● When the brake is applied

#### When the brake is released

A supply of compressed air from the brake releasing port causes the brake piston including the taper ring, to retract thereby freeing the steel balls from the taper ring, which releases the brake and lets the piston rod freely slide.

#### When the brake is applied

Exhausting compressed air from the brake releasing port causes the spring to press against the brake piston, transmitting components of spring force via the taper ring to the steel balls, which then works via the brake shoe to transmit a perpendicular force to the piston rod and to apply friction force to the brake.

#### Precautions for installation

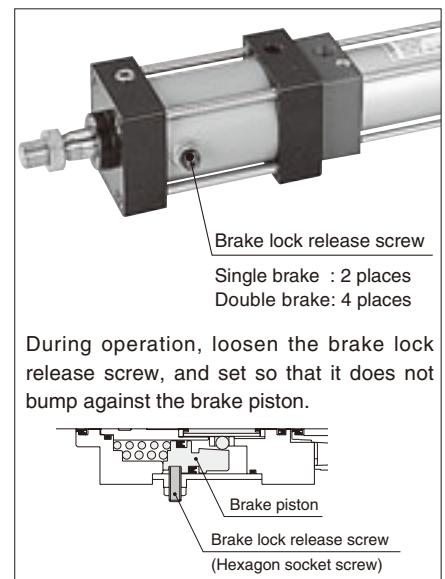

1. In the cylinder with brake, the brake piston in the single brake type is secured in place with 2 hexagon socket screws, and in the double brake type with 4 such screws, with the brake set in a released state at shipping.

When piping and installation is completed, or when performing operation checks, first supply at least 0.35MPa [51psi.] (0.4MPa [58psi.]) for bore size of  $\phi 50$  [1.969in.] of air to the brake release port, and remove the screws. Then exhausting the compressed air enables the piston rod to be held. While the unit could be operated with the screws removed, it is better for prevention of entering dust to use screws with nuts to secure it in place by inserting 2 or 3 thread ridges into the cylinder.

At this time, do not excessively tighten the screws as they could interfere with the brake piston, by re-locking it in place, or by constricting its movements.

2. Poor centering of the Cylinder with Brake may damage the seal or hasten wear on the brake shoe.

As poor centering could also result in inaccuracy of the stopping position, use of a cylinder joint is recommended.

## Handling Instructions and Precautions

### Mounting and piping (for cylinder with brake)

#### Control circuit

##### Electric control

When using a sequencer for control, the scanning time of the sequencer will affect the stopping position error. To improve the stopping position accuracy, use a TTL circuit, etc., to directly control the signal from the cylinder's sensor switch, and operate the valve.

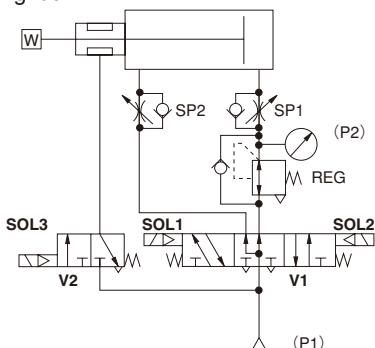

##### Pneumatic circuit

1. To achieve a balance with the load, and a balance of differences in rod diameter area, always use a regulator with check valve.
2. For the cylinder control solenoid valve (V1), use a PAB connection 3-position solenoid valve, etc.
3. Install the solenoid valve for the brake (V2) as close to the cylinder as possible. Moreover, using DC current solenoid valve will improve response (stopping position accuracy).

The figures in the table show the air flow rate and air consumption when an air cylinder makes 1 reciprocation with stroke of 1mm [0.0394in.]. The air flow rate and consumption actually required is found by the following calculations.

● Finding the air flow rate (for selecting F.R.L., valves, etc.)

Example: When operating an air cylinder with bore size of 40mm [1.575in.] at speed of 300mm/s [11.8in./sec.], and under air pressure of 0.5MPa [73psi.]

$$14.92 \times \frac{1}{2} \times 300 \times 10^{-3} = 2.24 \ell / \text{s} [0.0791 \text{ft.}^3/\text{sec.}] (\text{ANR})$$

$$(\text{At this time, the air flow rate per minute is } 14.92 \times \frac{1}{2} \times 300 \times 60 \times 10^{-3} = 134.28 \ell / \text{min} [4.74 \text{ft.}^3/\text{min.}] (\text{ANR})).$$

● Finding the air consumption

Example 1. When operating an air cylinder with bore size of 40mm [1.575in.] and stroke of 100mm [3.94in.], and under air pressure of 0.5MPa [73psi.], for 1 reciprocation

$$14.92 \times 100 \times 10^{-3} = 1.492 \ell [0.0527 \text{ft.}^3] / \text{Reciprocation (ANR)}$$

Example 2. When operating an air cylinder with bore size of 40mm [1.575in.] and stroke of 100mm [3.94in.], and under air pressure of 0.5MPa [73psi.], for 10 reciprocations per minute

$$14.92 \times 100 \times 10 \times 10^{-3} = 14.92 \ell / \text{min} [0.527 \text{ft.}^3/\text{min.}] (\text{ANR})$$

## Cylinder Thrust

Select a suitable cylinder bore size considering the load and air pressure to obtain the required thrust.

Since the figures in the table are calculated values, select a bore size that results in a load ratio (load ratio =  $\frac{\text{Load}}{\text{Calculated value}}$ ) of 70% or less (50% or less for high speed application).

 Strokes of 1001 or more:  $+2.0 [-0.079\text{in.}]$   
 2. For non-standard strokes, consult us.  
 3. Cylinders with magnets are not available for heat resistant specification and steel tube specification.  
 4. For the maximum available stroke with bellows specification, see p.538.

## Order Codes

### DYNA Cylinder Basic model

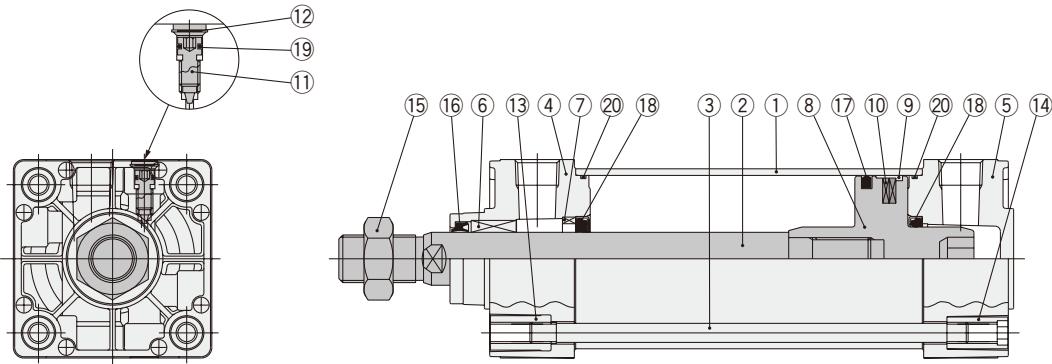

● Combinations of heat resistant, non-ion, and steel tube specifications are made to order.

Note: Heat resistant specification not available in  $\phi 32$  [1.260in.] and  $\phi 125$  [4.921in.].

### Rod end accessory

- Blank — No rod end accessory  
 Y — With Y type knuckle (with pin)  
 I — With I type knuckle  
 ● For the cylinder joint and cylinder rod end, see p.1568.  
 ● Orders for rod end accessories only are also accepted.  
 ● For dimensions of rod end accessories, see p.537.

## Inner Construction and Major Parts

## Major Parts and Materials

No.	Parts	Materials
①	Cylinder tube	Aluminum alloy, and steel tube specification is steel
②	Piston rod	φ32:Stainless steel, φ40~φ125:Carbon steel for machine structural use
③	Tie rod	Carbon steel for machine structural use
④	Rod cover	Aluminum die-casting
⑤	Head cover	Aluminum die-casting
⑥	Rod bushing	Oil impregnated sintered copper alloy
⑦	Keep ring	Aluminum alloy
⑧	Piston	Aluminum alloy
⑨	Wear ring	Plastic
⑩	Magnet	Rubber magnet
⑪	Cushion needle	Carbon steel for machine structural use
⑫	Snap ring	Spring steel
⑬	Tie rod nut R	Rolled steel for general structural use
⑭	Tie rod nut H	Chrome-molybdenum steel
⑮	Rod end nut	Rolled steel for general structural use
⑯	Rod seal	Synthetic rubber (NBR)

No.	Parts	Materials
⑰	Piston seal	Synthetic rubber (NBR)
⑱	Cushion seal	Synthetic rubber (NBR)
⑲	Cushion gasket	Synthetic rubber (NBR)
⑳	Tube gasket	Synthetic rubber (NBR)
—	Foot mounting bracket	Rolled steel for general structural use
—	Axial foot mounting bracket	Cast iron
—	Flange mounting bracket	Rolled steel for general structural use
—	Clevis mounting bracket	Cast iron
—	Clevis supporting bracket	Cast iron
—	Pivot mounting bracket	Cast iron
—	Trunnion bracket	Cast iron
—	Trunnion supporting bracket	Cast iron
—	Knuckles	Cast iron <sup>Note</sup>

Note: The I knuckle for φ 125 only, is carbon steel for machine structural use.

Caution: Figures in the table are a combination of stroke 2 (standard) corresponding to stroke 1 (standard). ● About stroke 1 and stroke 2

Remarks: 1. Stroke tolerance; Strokes of 250 or less: +1<sup>+</sup> [ +0.039in.]

Strokes of 251~1000: +1.5<sup>+</sup> [ +0.059in.]

2. For non-standard strokes, consult us.

3. For the maximum available stroke with bellows specification, see p.538.

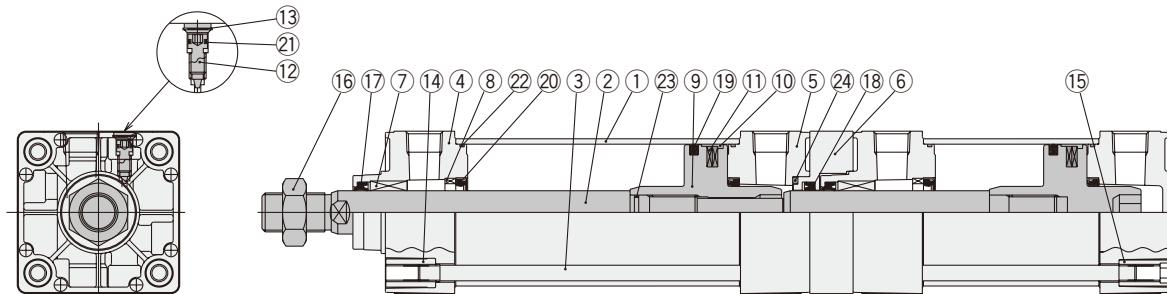

Stroke 1 is the stroke of cylinder 1.  
Stroke 2 is obtained by subtracting stroke 1 from the stroke of cylinder 2.

## Inner Construction and Major Parts

### Operation principle of tandem cylinders

Tandem Cylinders are a set of 2 cylinders joined end to end. It can be used as a 2-stage stroke cylinder by supplying air to either Port A or Port B. It can also obtain twice the thrust within the stroke 1 range.

The rods retract strokes 2 and 1 when air is supplied from Port C.

The rod moves stroke 1 when air is supplied from Port A.

The rod moves stroke 2 when air is supplied from Port B.

Twice the thrust is obtained within the stroke 1 range when air is supplied from Ports A and B.

### ● About stroke 1 and stroke 2

Stroke 1 is the stroke of cylinder 1.  
Stroke 2 is the stroke of cylinder 2.

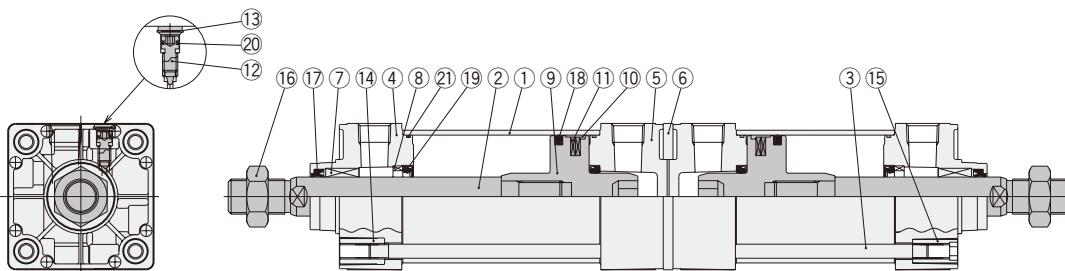

Remarks: 1. Stroke tolerance; Strokes of 250 or less:  $+1_0^1$  [ $+0.039\text{in.}$ ]  
Strokes of 251~1000:  $+1.5_0^1$  [ $+0.059\text{in.}$ ]

- The table to the left applies to both stroke 1 and stroke 2.  
However, do not let (stroke 1 + stroke 2) exceed the maximum stroke.
- For non-standard strokes, consult us.
- For the maximum available stroke with bellows specification, see p.538.

## Inner Construction and Major Parts

### Operation of dual stroke cylinders

Dual Stroke Cylinders are a set of 2 cylinders connected back to back. The cylinder body can be secured in place and each stroke can be controlled separately. It can also be used to obtain 2-stage or 3-stage strokes by securing the piston rod on one side in place.

## Major Parts and Materials

No.	Parts	Materials
①	Cylinder tube	Aluminum alloy
②	Piston rod	Carbon steel for machine structural use
③	Tie rod	Carbon steel for machine structural use

## Order Codes

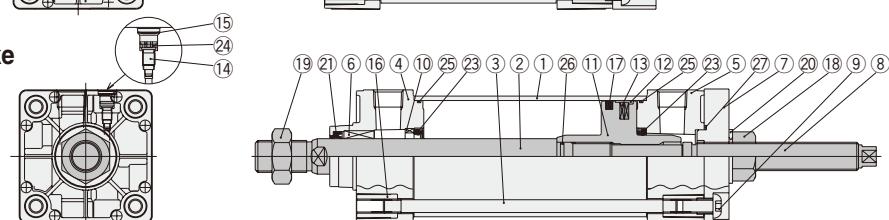

## Inner Construction and Major Parts

### ● Push side stroke adjusting type

### ● Pull side stroke adjusting type

### ● Instructions for stroke adjustment

Stroke adjusting is performed by rotating the adjusting stopper (push side 19) or stroke adjusting screw (pull side 8). After completing stroke adjustment, secure the adjusting stopper or adjusting screw in place with a lock nut. If mounting a sensor switch, move the mounting location of the sensor switch along the length of the adjusted stroke.

## Specifications

Item	Bore size mm [in.]	32 [1.260]	40 [1.575]	50 [1.969]	63 [2.480]	80 [3.150]	100 [3.940]
Operation type	Double acting type						
Media	Turbine oil with defoaming agent (ISO VG22~100 or equivalent) or petroleum-based hydraulic oil						
Mounting type	Basic type, Foot type, Axial foot type, Rod side flange type, Head side flange type, Clevis type, Pivot type, Trunnion type						
Operating pressure range MPA [psi.]	0.2~1.0 [29~145]						
Proof pressure MPA [psi.]	1.5 [218]						
Operating temperature range °C [°F]	0~60 [32~140]						
Operating speed range mm/s [in./sec.]	1~150 [0.04~5.9]						
Cushion	None						
Port size	Rc	1/8	1/4	3/8	1/2		

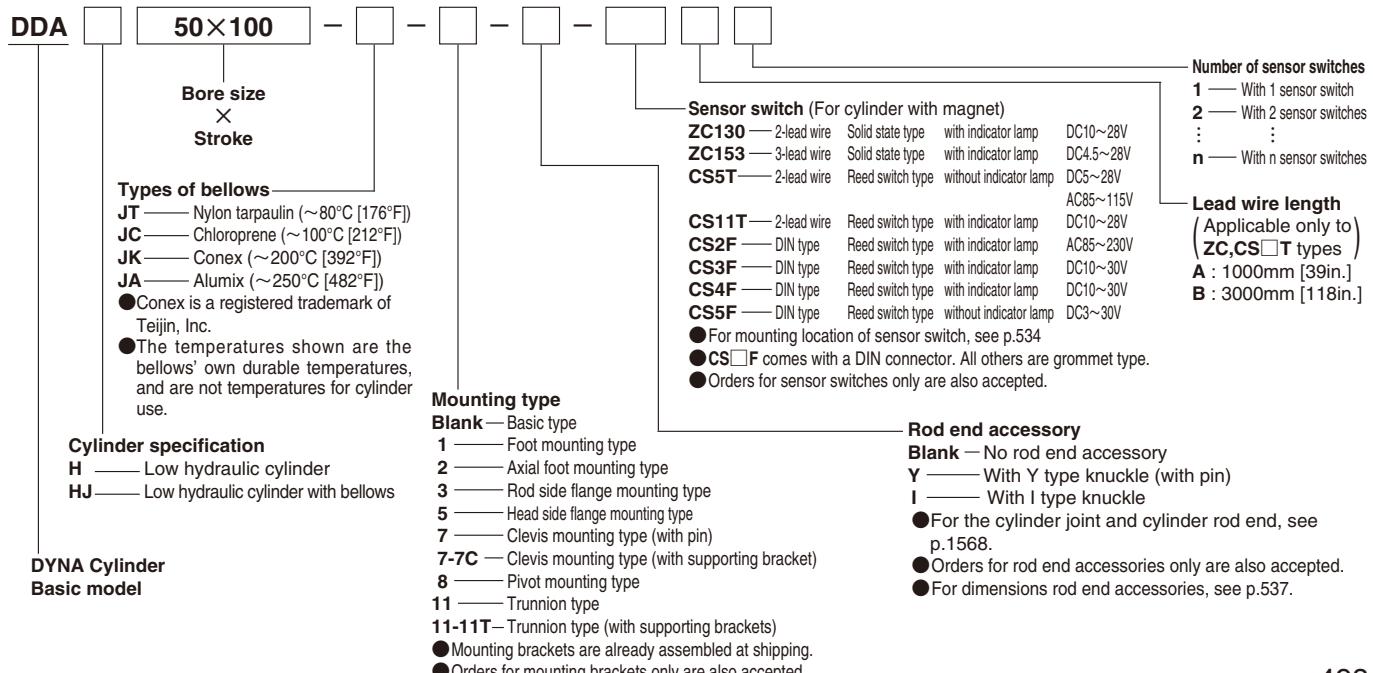

- Notes: 1. For low hydraulic cylinders, use of oil on both sides is recommended. Use of air on one side and oil on the other side could lead to an inability to maintain accurate speed control, or to oil leaking into the air side. Moreover, use meter-out control for the speed control.  
 2. If mounting a reed switch type sensor switch, set the minimum speed to 30mm/s or more.  
 3. Nonflammable hydraulic oil, machine oil, or spindle oil cannot be used.  
 4. Be aware that a change in oil temperature can cause the speed to change.

Cushion stroke mm [in.]	16 [0.630]	20 [0.787]	25 [0.984]			
Lubrication	Not required (If lubrication is required, use Turbine Oil Class 1 (ISO VG32) or equivalent.)					
Port size	Rc	3/8				

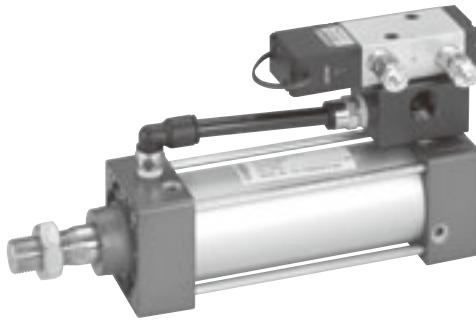

## Solenoid Valve Specifications

Series	350 series
Solenoid specification	Single solenoid
Item	Model
VP350-4E1-70	
Operation type	Indirect operation
Number of positions and ports	2 positions, 5 ports
Effective area [Cv] mm <sup>2</sup>	26.5 [1.47]
Port size	Rc
1/4	
Lubrication	Not required
Operating pressure range MPa [psi.]	0.17~0.7 [25~102]
Proof pressure MPa [psi.]	1.1 [160]
Operating temperature range °C [°F]	5~50 [41~122]
Shock resistance G	90
Mounting direction	Any
Maximum operating frequency cycle/s	5

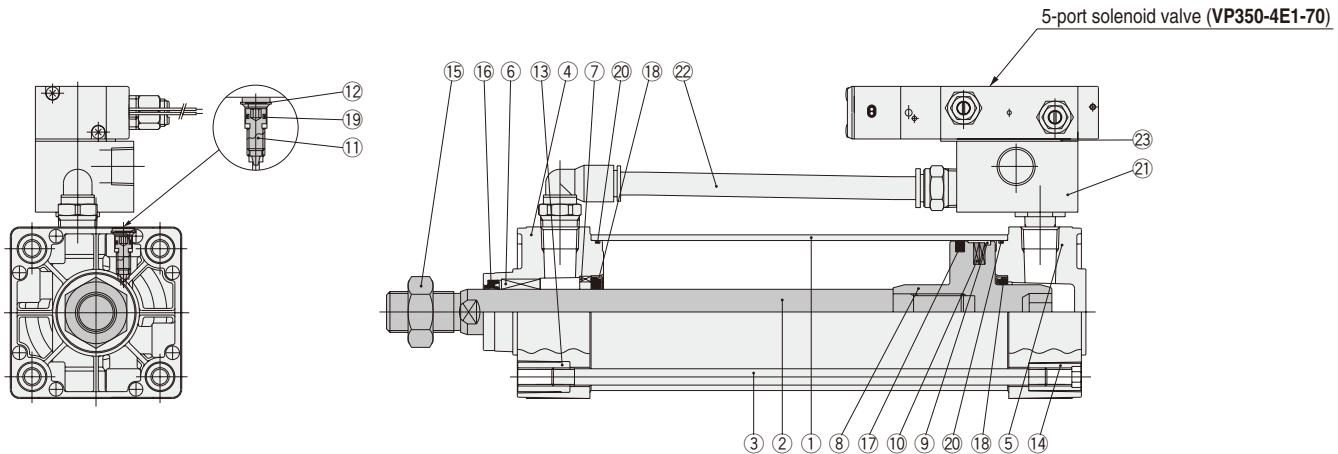

## Order Codes

Remarks: 1. The order code of the valpack valve only is VP350-4E1-70-Voltage.  
2. For made to order valves, or for double solenoid, 3-position, locking type manual override, plug connector, DIN connector, or LED indicator, consult us.

## Switching from Push to Pull Type Cylinder When Energizing

Remove the valve mounting screws, turn the valve 180°, and re-assemble. At this time, confirm that the valve adapter gasket is in the designated position between the valve and the valve adapter.

## Major Parts and Materials

No.	Parts	Materials
①	Cylinder tube	Aluminum alloy, and steel tube specification is steel
②	Piston rod	φ32:Stainless steel, φ40~φ125:Carbon steel for machine structural use
③	Tie rod	Carbon steel for machine structural use
④	Rod cover	Aluminum die-casting
⑤	Head cover	Aluminum die-casting
⑥	Rod bushing	Oil impregnated sintered copper alloy
⑦	Keep ring	Aluminum alloy
⑧	Piston	Aluminum alloy
⑨	Wear ring	Plastic
⑩	Magnet	Rubber magnet
⑪	Cushion needle	Carbon steel for machine structural use
⑫	Snap ring	Spring steel
⑬	Tie rod nut R	Rolled steel for general structural use
⑭	Tie rod nut H	Chrome-molybdenum steel
⑮	Rod end nut	Rolled steel for general structural use
⑯	Rod seal	Synthetic rubber (NBR)

No.	Parts	Materials
⑰	Piston seal	Synthetic rubber (NBR)
⑱	Cushion seal	Synthetic rubber (NBR)
⑲	Cushion gasket	Synthetic rubber (NBR)
⑳	Tube gasket	Synthetic rubber (NBR)
㉑	Valve adapter	Aluminum alloy
㉒	Bypass tube	Nylon tube
㉓	Valve adapter gasket	Synthetic rubber (NBR)
—	Foot mounting bracket	Rolled steel for general structural use
—	Axial foot mounting bracket	Cast iron
—	Flange mounting bracket	Rolled steel for general structural use
—	Clevis mounting bracket	Cast iron
—	Clevis supporting bracket	Cast iron
—	Pivot mounting bracket	Cast iron
—	Trunnion bracket	Cast iron
—	Trunnion supporting bracket	Cast iron
—	Knuckles	Cast iron

Note: For lead wire length A (1000mm [39in.]).

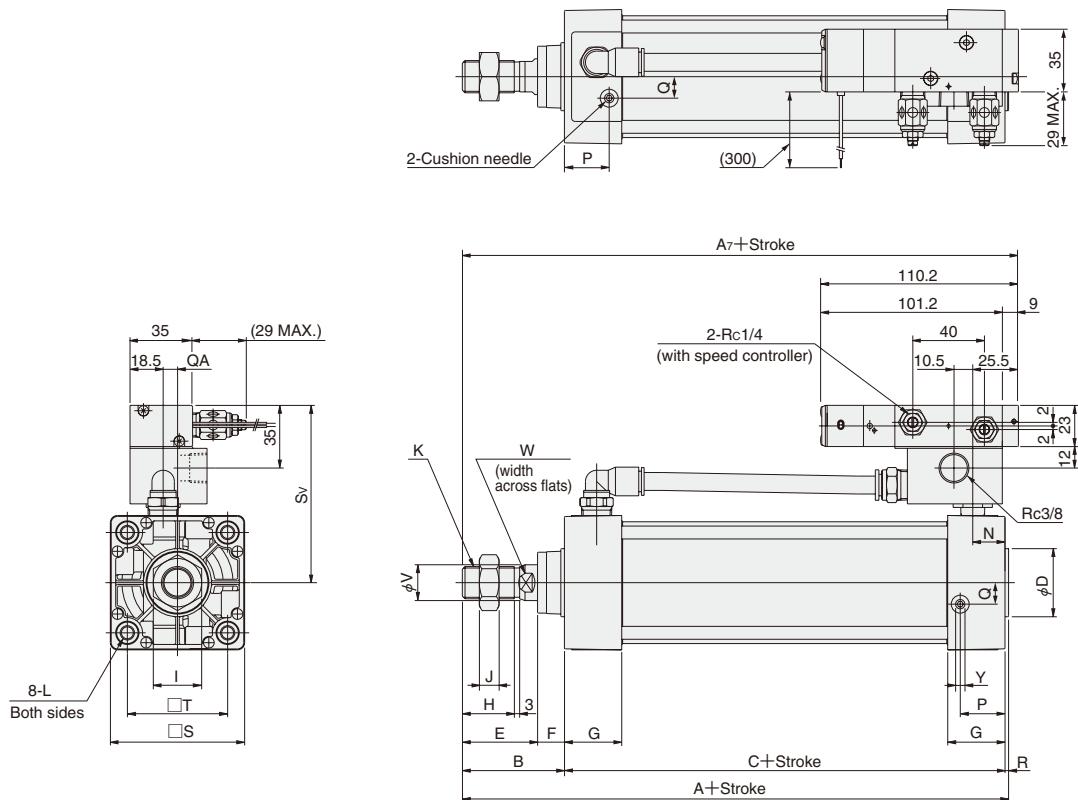

Remark: Figures in parentheses ( ) are for steel tube specification.

Calculation example: For foot mounting type with bore size of 50mm, and stroke of 100mm,  
 $1.43 + (0.00428 \times 100) = 1.858\text{kg}$  [4.097lb.]

Item	Bore size mm [in.]	40 [1.575]	50 [1.969]	63 [2.480]	80 [3.150]	100 [3.940]
Operation type	Double acting type with head side or rod side stroke end keep mechanism					
Media	Air					
Mounting type	Basic type, Foot type, Axial foot type, Rod side flange type, Head side flange type, Clevis type, Pivot type, Trunnion type					
Operating pressure range	MPa [psi.]	0.15~1.0 [22~145]				
Proof pressure	MPa [psi.]	1.5 [218]				
Operating temperature range	°C [°F]	-10~70 [14~158] (Freezing prohibited. With sensor is 0~60 [32~140].)				
Operating speed range	mm/s [in./sec.]	30~700 [1.2~27.6]				
Cushion	Variable cushion at both ends of stroke					
Cushion stroke	mm [in.]	16 [0.630]	20 [0.787]	25 [0.984]		
Lubrication	Not required (If lubrication is required, use Turbine Oil Class 1 (ISO VG32) or equivalent.)					
Maximum holding force (at end keep)	N [lbf.]	880 [198]	1374 [309]	2182 [491]	3519 [791]	5498 [1236]

<b>100</b>		

Remarks:

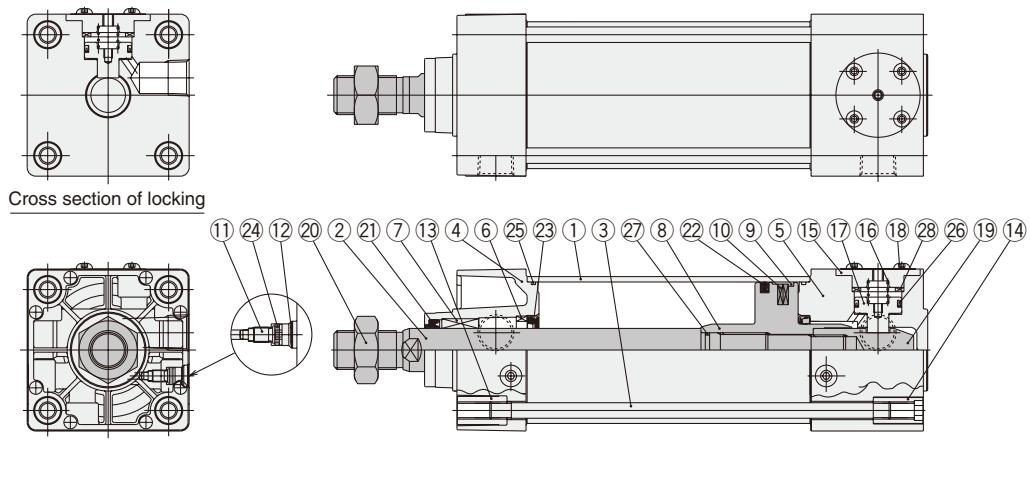

1. Stroke tolerance:  
 Strokes of 250 or less:  $+1_0^0$  [ $+0.039\text{in.}$ ]  
 Strokes of 251~1000:  $+1.5_0^0$  [ $+0.059\text{in.}$ ]  
 Strokes of 1001 or more:  $+2.0_0^0$  [ $+0.079\text{in.}$ ]
2. For non-standard strokes, consult us.
3. Cylinders with magnets are not available for steel tube specification.
4. For the maximum available stroke with bellows specification, see p.538.

63	50, 75, 100, 150, 200, 250, 300, 350, 400, 450,		
80	500, 600, 700, 800, 900, 1000	1500	
100			

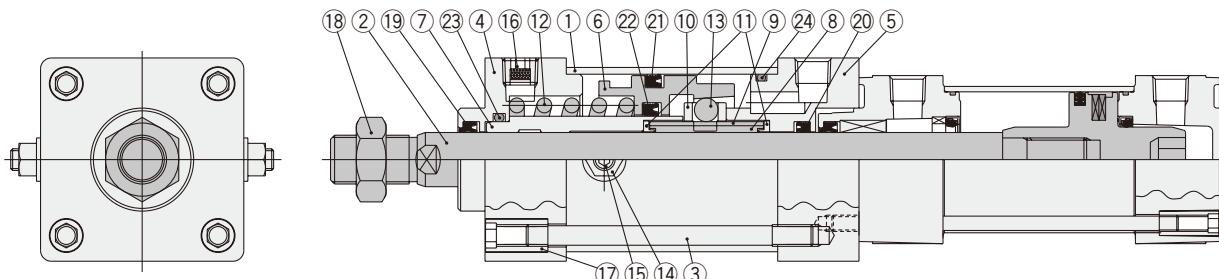

Remarks:  
 1. Stroke tolerance;  
 Strokes of 250 or less:  $\pm 1 [+0.039\text{in.}]$   
 Strokes of 251~1000:  $\pm 1.5 [+0.059\text{in.}]$   
 Strokes of 1001 or more:  $\pm 2 [+0.079\text{in.}]$   
 2. For non-standard strokes, consult us.  
 3. Cylinders with magnets are not available for heat resistant specification and steel tube specification.  
 4. For the maximum available stroke with bellows specification, see p.538.

### Order Codes

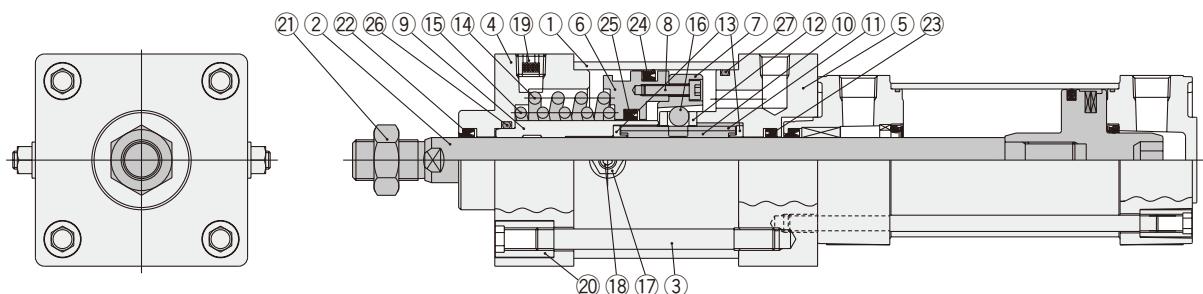

DDA	[ ]	50×100	- [ ] - [ ] - [ ] - [ ] - [ ] - [ ] - [ ] - [ ]	Number of sensor switches

## Sensor Switch Operating Range, Response Differential, and Maximum Sensing Location

### ● ZC1□□ type, CS□T type, CS□F type

#### ● Operating range: $\ell$

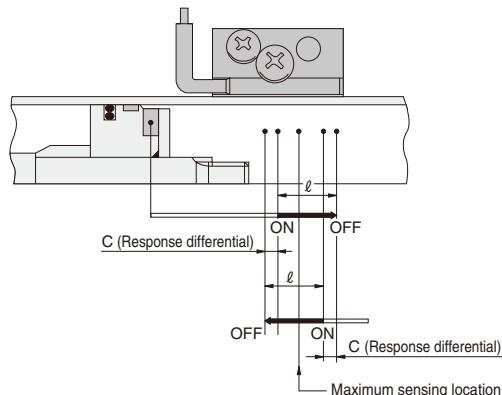

The distance the piston travels in one direction, while the switch is in the ON position.

#### ● Response differential: C

The distance between the point where the piston turns the switch ON and the point where the switch is turned OFF as the piston travels in the opposite direction.

Sensor switches model	Solid state type	Reed switch type

Operating range: $\ell$	2~6 [0.079~0.236]	6~15 [0.236~0.591]			
Response differential: C	1.5 [0.059] MAX.	2.5 [0.098] MAX.			
Maximum sensing location	8.5 [0.335]	7 [0.276]	10.5 [0.413]	16 [0.630]	

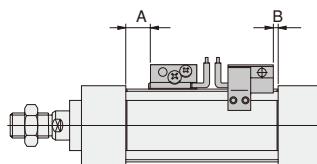

Notes: 1. Figures in the grommet type are lengths measured from the switch's opposite end side to the lead wire, while the figures in connector type are lengths measured from the connector side's end surface.  
2. The above table shows reference values.

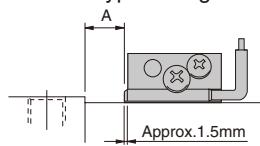

## Mounting Location of Sensor Switch

When the sensor switch is mounted in the locations shown in the diagram (figures in the table are reference values), the magnet comes to the sensor switch's maximum sensing location at the end of the stroke.

Caution: The reed sensor switch cannot be mounted on the head side in any direction other than that shown in the diagram.

### ● Precaution for mounting

For the ZC type sensor switches, the surface opposite to the model marking surface is the sensing surface side. Mount so that the cylinder magnet comes to the sensing surface side.

## Instructions for Mounting and Moving Sensor Switch

### ZC1□□, CS□T types

Requiring parts for mounting 1 sensor switch on a cylinder

- ①Sensor Switch
- ②Washer×1
- ③Screw (short)×1
- ④Sensor holder×1
- ⑤Setscrew×2
- ⑥Tie rod
- ⑦Screw (long)×1
- ⑧Sub-holder×1

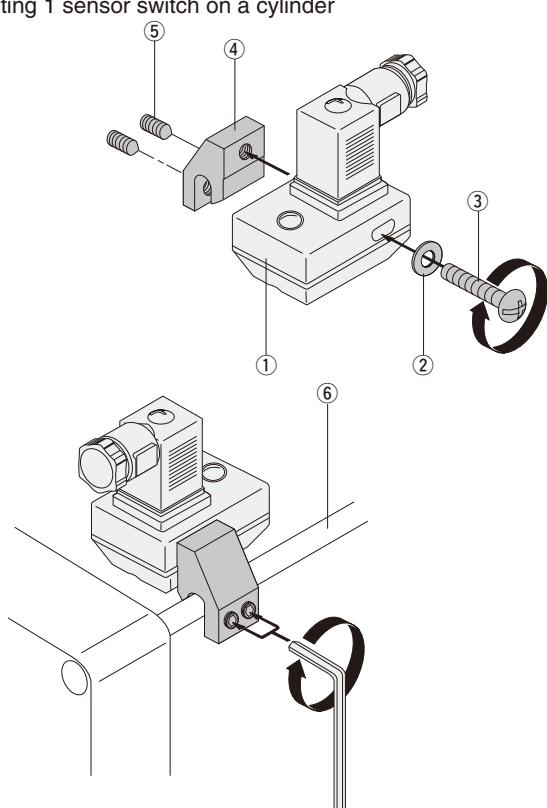

1. ● Align the female thread of sensor holder ④ to the position of the sub-holder ⑧'s thru hole, and use a screw (long) ⑦ to assemble.  
● Two thru holes are available for ⑧. Either one can be used.  
● The appropriate tightening torque for ⑦ is 70 N·cm [6.2in·lbf].
2. ● Install the sensor switch ① with the model marking surface facing upward, and fit it on the groove of ⑧.  
● Align the edges of the body ① and indicator lamp (or the cap) to the end plane of ⑧, and assemble. To protect ①, always assemble so that the body ① does not protrude from the end surface of ⑧.  
● The appropriate tightening torque for the screw (short) ③ is 70N·cm [6.2in·lbf].
3. ● Two setscrews ⑤ are temporarily fixed ④ in place.  
● Fit ④ that was assembled with ① and ⑧ onto the tie rod ⑥, and align it to the designated position. Then use an Allen wrench (width across flats B = 2) to tighten ⑤ and secure it in place. Always secure it so that the bottom surface of ⑧ is in contact with the cylinder tube.  
● The appropriate tightening torque for ⑤ is 70 N·cm [6.2in·lbf].  
● There are four ⑥s on the cylinder, and ④ can be installed on any of them. In addition, ④ can be fitted in any direction.  
● Loosening the 2 screws ⑤ allows ④ to be moved freely along ⑥.

### CS□F type

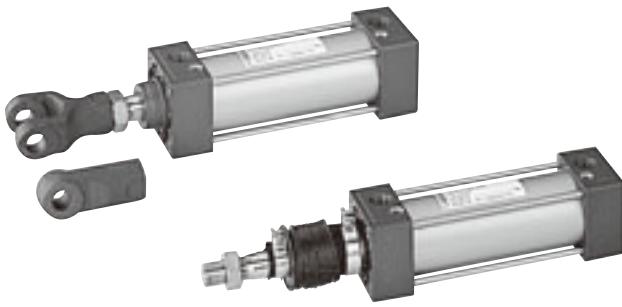

Requiring parts for mounting 1 sensor switch on a cylinder

- ①Sensor Switch
- ②Washer×1
- ③Screw×1
- ④Sensor holder×1
- ⑤Setscrew×2
- ⑥Tie rod

1. ● For the sensor switch ①, align the female thread of sensor holder ④ to any required location of the ①'s thru hole (oval), and assemble.  
● The appropriate tightening torque for the screw ③ is 70N·cm [6.2in·lbf].
2. ● Use 2 setscrews ⑤ to temporarily fix ④ in place.  
● Fit ④ that was assembled with ① onto the tie rod ⑥, and align it to the designated position. Then use an Allen wrench (width across flats B = 2) to tighten ⑤ and secure it in place. Always secure it so that the bottom surface of ① is in contact with the cylinder tube.  
● To detect the head side end of stroke, mount ① so that the connector wiring port faces toward the head cover side, as shown in the diagram to the left.  
● The appropriate tightening torque for ⑤ is 70N·cm [6.2in·lbf].  
● There are four ⑥s on the cylinder, and ④ can be installed on any of them. In addition, ④ can be fitted in any direction.  
● Loosening the 2 screws ⑤ allows ④ to be moved freely along ⑥.
