Air Cylinder

SLIM CYLINDER

INSTRUCTION MANUAL Ver.1.0

Handling Instructions and Precautions

Control circuit

For control of Slim End Keep Cylinders, we recommend the use of 2-position, 4-, 5-port valves. Avoid the use of a control circuit or exhaust centers with 3-position valves or other control circuits that exhaust air from 2 delivery ports.

- Notes:
1. It is dangerous to supply air to a connection port on a side with a locking mechanism while already exhausted, because the piston rod could suddenly extend (or retract). In addition, since it could also cause galling of the lock piston and piston rod, resulting in defective operation. Always supply air to the connection port on the opposite side to ensure that back pressure is applied.
 2. When restarting operations after air has been exhausted from the cylinder due to completion of operations or to an emergency stop, always start by supplying air to the connection port on the opposite side of the locking mechanism.

Manual operation

While the locking mechanism is normally released automatically through cylinder operations, it can also be released manually. For manual release, insert an M3 × 0.5 (M2.5×0.45 for ϕ 16) screw that has 30mm [1.18in.] below head length into the opening for manual override, thread it in about 3 turns into the internal lock piston, and then pull up the screw. To maintain the manual override for adjustment, etc., thread the locknut onto the screw and, with the locking mechanism in a released state, tighten the locknut against the cylinder.

Notes:

1. It is dangerous to release the lock when a load (weight) is present on the piston rod, because it may cause a sudden fall or cause the unintended piston rod's extension (or retraction). In this case, always supply air to the connection port opposite the one adjacent to the locking mechanism before releasing the locking mechanism.
2. If the locking mechanism cannot easily be released even with manual override, it could be the result of galling of the lock piston and piston rod. In this case, supply air to the connection port opposite the one adjacent to the locking mechanism before releasing the locking mechanism.

General precautions

Media

1. Use air for the media. For the use of any other media, consult us.
2. Air used for the cylinder should be clean air that contains no deteriorated compressor oil, etc. Install an air filter (filtration of a minimum 40 μ m) near the cylinder or valve to remove collected liquid or dust. In addition, drain the air filter periodically. Collected liquid or dust entering the cylinder may cause improper operation.

Lubrication

The product can be used without lubrication, if lubrication is required, use Turbine Oil Class 1 (ISO VG32) or equivalent. Avoid using spindle oil or machine oil.

Atmosphere

1. Because water, oil, dust, etc., entering the opening for manual override may cause defective locks or other erratic operation. If using in locations subject to dripping water, dripping oil etc., or to large amounts of dust, use a cover to protect the unit.
2. The product cannot be used when the media or ambient atmosphere contains any of the substances listed below. Organic solvents, phosphate ester type hydraulic oil, sulphur dioxide, chlorine gas, or acids, etc.

Control circuit

Electric control

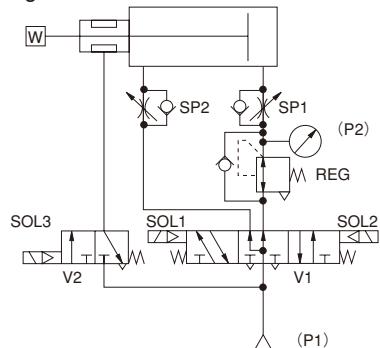

When using a sequencer for control, the scanning time of the sequencer will affect the stopping position error. To improve the stopping position accuracy, use a TTL circuit, etc., to directly control the signal from the cylinder's sensor switch, and operate the valve.

Pneumatic circuit

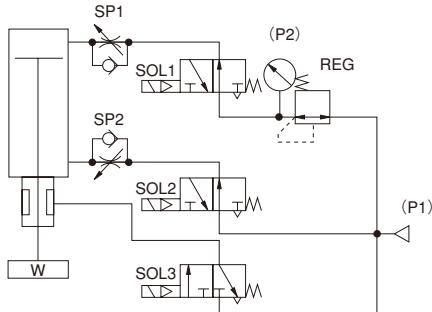

1. To achieve a balance with the load, and a balance of differences in rod diameter area, always use a regulator with check valve. Regulators we recommend include the F.R.L. multi series **R152**, the manifold regulator **MR102**, or the solenoid valve 180 series sub-base regulator -54 (for single unit order code: **M020014**).
2. For the cylinder control solenoid valve (V1), use a pressure center type 3-position solenoid valve (**113-4E2-14**, **183-4E2-14**), etc.
3. Install the solenoid valve for brake (V2) as close to the cylinder as possible. Moreover, using a DC current solenoid valve will improve response (repeatability).

Brake mechanism

Manual operation

● Brake release

Apply 0.3~0.9MPa [44~131psi.] air pressure to the brake release port, then use a small screwdriver, etc., to thread the brake lock releasing screw in the clockwise direction until the screw thread disappears.

● Brake operation

To again operate the brake, apply 0.3~0.9MPa [44~131psi.] air pressure to the brake release port, then use a small screwdriver, etc., to return the brake lock releasing screw in the counterclockwise direction until the screw comes to a stop.

● Brake release

For safety, the brake lock releasing screw is designed to be immovable if no air has been applied to the brake release port.

Spring assisted air pressure lock

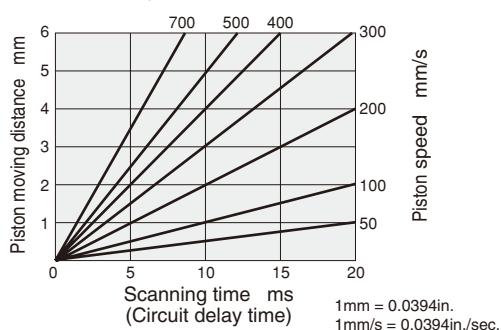

- To increase the holding force, use a screwdriver, etc., to remove the filter on the brake pressurizing port and use it as a connection port for spring assisted air pressure type brake.
- While using a spring assisted air pressure brake will approximately double the holding force, too much pressure on the brake pressurizing port could reduce the durability of the brake mechanism. For this reason, always maintain air pressure in the pressurizing port within a range of 0.34~0.50MPa [49~73psi.] when using a 4 way valve to switch between the brake release port and the pressurizing port.

Stopping position accuracy

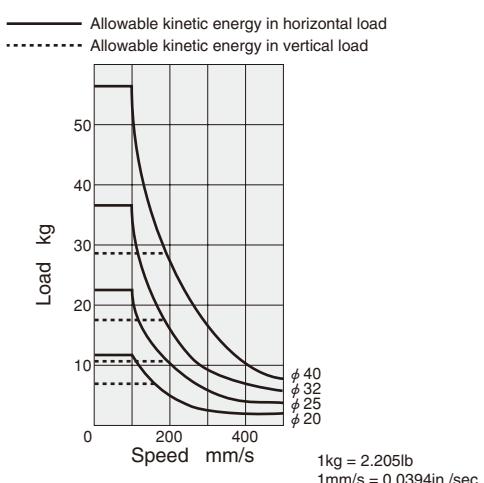

1. Stopping position accuracy (repeatability) shown in the specifications table is for initial conditions. This can change over time as the piston rod grease deteriorates, and as wear on the brake shoe and piston rod progresses.
2. The stopping position accuracy can vary in accordance with cylinder speed, control circuit delay time (sequencer scanning time, etc.), fluctuation in brake valve (V2) operating time, piping length, and piping diameter, etc.
3. To improve the stopping position accuracy, install a pressure reducing valve to ensure there are no pressure fluctuations in the media.
4. Use the brake cylinder within the allowable kinetic energy range.

● Fluctuations in cylinder stopping time arising during the sequencer's scanning time (or circuit operating time).

● Allowable kinetic energy when locked

- Examples:
1. A brake cylinder operated at a scanning time of 10ms (which will vary according to the sequencer and the number of program steps) and a cylinder speed of 300mm/s [11.8in./sec.] will cause a fluctuation of 3mm [0.118in.].
 2. When 10ms is required for the response time of relays, etc., at least 3mm [0.118in.] of operating distance is required for the sensor.
(When the cylinder speed is 300mm/s [11.8 in./sec.])

Note: Use the brake cylinder within the allowable kinetic energy range.

General precautions

Media

1. Air used in the brake cylinder should be clean air that contains no lubrication. Use of lubrication or humidified air could cause the grease inside the braking mechanism to wash out, which could later result in rapid wear on the braking mechanism caused by the consequent shortage of lubrication, etc.
2. Air used for the cylinder should be clean air that contains no deteriorated compressor oil, etc. Install an air filter (filtration of a minimum 40 µm) near the cylinder or valve to remove collected liquid or dust. In addition, drain the air filter periodically. Collected liquid or dust entering the cylinder may cause improper operation.

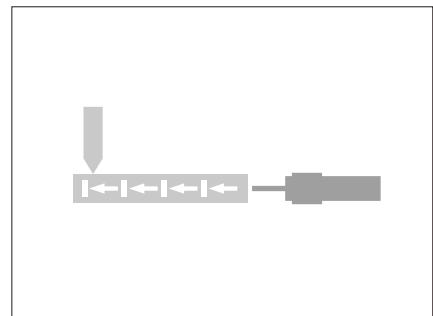

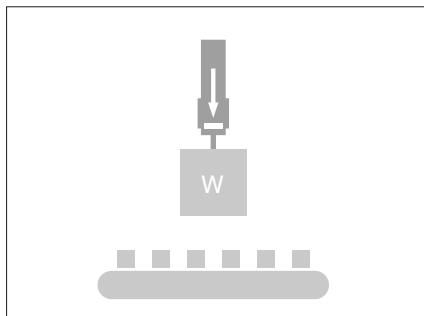

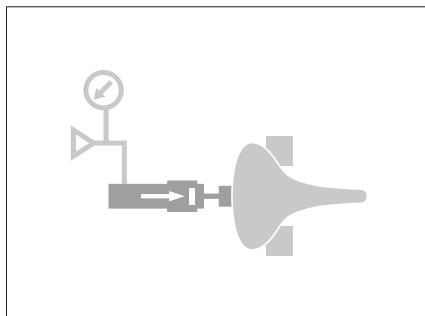

Maintenance

If the above basic precautions are observed, the brake cylinder can be used maintenance-free for a long period of time.

Atmosphere

1. If using in locations subject to dripping water, dripping oil, etc., or to large amounts of dust, use a cover to protect the unit.
2. The product cannot be used when the media or ambient atmosphere contains any of the substances listed below.
Organic solvents, phosphate ester type hydraulic oil, sulphur dioxide, chlorine gas, or acids, etc.

Application Examples

The piston rod locking

Use low pressure to press down cathode-ray tubes, etc., and then lock.

[To hold in place glass products, plastic, and other easily deformable items.]

- Cathode-ray tube manufacturing line
- Injection machine peripheral devices
- Tire production line

Prevention of falls in intermediate positions

The load is locked in place to prevent damage to work, etc., even when air pressure drops suddenly due to power failures, etc.

[Used for working operations which are set in intermediate positions.]

- Pick and place
- FMS (multi-item, small-lot production) conveyor line
- Automatic packaging machine

Multi-point operations

Spot welding at multiple points.

Workpiece switching

Select the products, and classify into several categories.

Fixture replacement

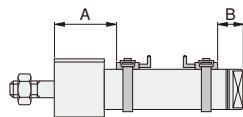

Move fixture to desired device.

- Spot welding machine
- Metal mold exchange
- Automatic chuck exchange

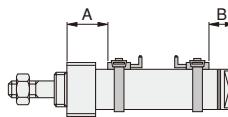

Mounting Location of Sensor Switch

When the sensor switch is mounted in the location shown in the diagram (figures in the tables are reference values), the magnet comes to the sensor switch's maximum sensing location at the end of the stroke.

Notes: 1. The low hydraulic cylinder is recommended to be used with oil on both sides. The use of oil on one side and air on the other side could result in imprecise speed control, and oil could leak across to the air side. In addition, use meter-out control for the speed control.
 2. Bore sizes ϕ 50 and ϕ 63 have air bleed ports. Loosen the plugs to bleed air of the cylinder inside.

3. When using the reed switch type sensor, maintain a minimum speed of 30mm/s [1.2in./sec.] or more.
 4. Do not use nonflammable hydraulic fluid, machine oil, or spindle oil.
 5. Be aware that changes in oil temperature can alter the speed.

| | Current mA (r.m.s.) | 140 | 130 | 70 |
| Insulation resistance MΩ | | 100 or more | | |
| Wiring and lead wire length | | Grommet type: About 300mm [11.8in.] | | |
| Color of lead wire | | Yellow and black | White and black | Red and black |

- Notes:
- While voltages other than those listed above can be manufactured, consult us about delivery for voltages other than AC100V and AC200V.
 - Since air pressure being used as a self-holding force could cause it to be unstable when using the VPS062-4E2 solenoid valve, always supply power with an electric circuit, to the solenoid valve, while the cylinder is in operation.
 - Consult us about surge suppression measures.

Bore Size and Stroke

● Standard rod cylinder

| Bore size | Standard strokes | Maximum stroke | Maximum available stroke |
|-----------|----------------------------------|----------------|--------------------------|
| 20 | 25 50 75 100 125 150 | 200 | 1050 (740) |
| 25 | 25 50 75 100 125 150 200 | 250 | |
| 32 | 25 50 75 100 125 150 200 | 300 | |
| 40 | 25 50 75 100 125 150 200 250 300 | 400 (300) | |

● Square rod cylinders

| Bore size | Standard strokes | Maximum stroke | Maximum available stroke |
|-----------|----------------------|----------------|--------------------------|
| 20 | 25 50 75 100 125 150 | 150 | 500 |
| 40 | | | |

Remarks:

- Stroke tolerance $+1_{-0}^0$ [+0.039in.]
- For non-standard strokes, consult us.
- Figures in parentheses () are for cylinders with bellows.
- The minimum operating pressure when the stroke is over the maximum stroke is 0.2MPa [29psi].

Mass

● Standard rod cylinder

| Solenoid valve | Bore size mm | Zero stroke mass | | | Additional mass for each 1mm [0.0394in.] stroke |
|----------------|--------------|------------------|-------------|-------------|---|
| | | Basic type | Foot type | Flange type | |
| 062 series | 20 | 0.49 [1.08] | 0.62 [1.37] | 0.57 [1.26] | 0.69 [1.52] 0.0008 [0.0018] |
| | 25 | 0.54 [1.19] | 0.68 [1.50] | 0.62 [1.37] | 0.73 [1.61] 0.0011 [0.0024] |
| | 32 | 0.64 [1.41] | 0.79 [1.74] | 0.74 [1.63] | 0.82 [1.81] 0.0015 [0.0033] |
| | 40 | 0.80 [1.76] | 1.01 [2.23] | 0.93 [2.05] | 0.97 [2.14] 0.0024 [0.0053] |
| 125 series | 40 | 0.86 [1.90] | 1.08 [2.38] | 0.99 [2.18] | 1.04 [2.29] 0.0024 [0.0053] |

Calculation example: For the mass of foot mounting type of 32mm bore size and 100mm stroke
 $0.79 + (0.0015 \times 100) = 0.94\text{kg}$ [2.07lb.]

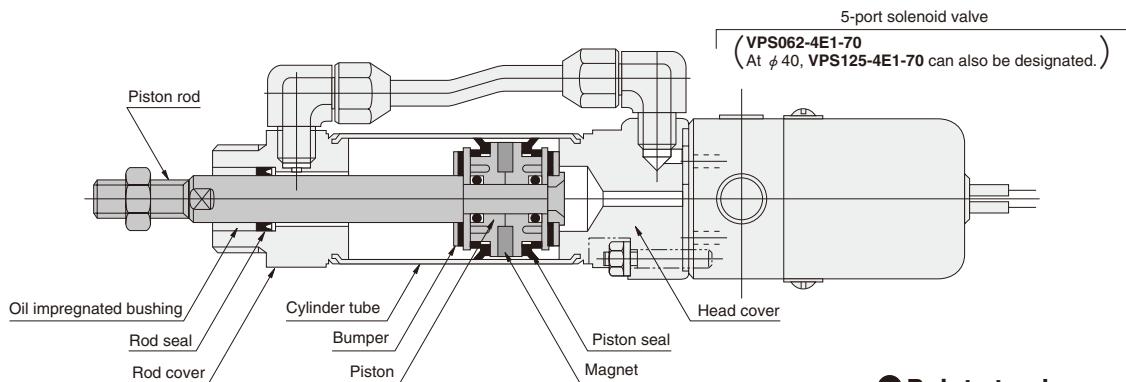

● Square rod cylinder

| Solenoid valve | Bore size mm | Zero stroke mass | | | Additional mass for each 1mm [0.0394in.] stroke |
|----------------|--------------|------------------|-------------|-------------|---|
| | | Basic type | Foot type | Flange type | |
| 062 series | 25 | 0.53 [1.17] | 0.67 [1.48] | 0.61 [1.35] | 0.72 [1.59] 0.0009 [0.0020] |
| | 40 | 0.81 [1.79] | 1.02 [2.25] | 0.94 [2.07] | 0.98 [2.16] 0.0021 [0.0046] |
| | 40 | 0.87 [1.92] | 1.09 [2.40] | 1.00 [2.21] | 1.05 [2.32] 0.0021 [0.0046] |

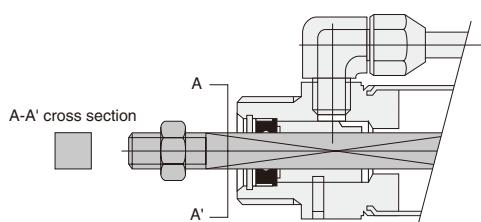

Calculation example: For the mass of foot mounting type of 25mm bore size and 100mm stroke
 $0.67 + (0.0009 \times 100) = 0.76\text{kg}$ [1.68lb.]

● For the mass of the mounting bracket, see p.315.

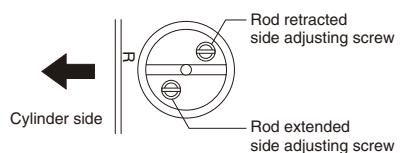

Inner Construction and Major Parts (Cylinder body cannot be disassembled)

● Square rod cylinders

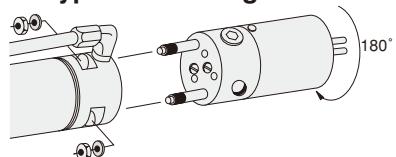

● Handling of speed controller

Adjusting the screw clockwise will throttle the exhaust air, and slow the rod (piston) speed.

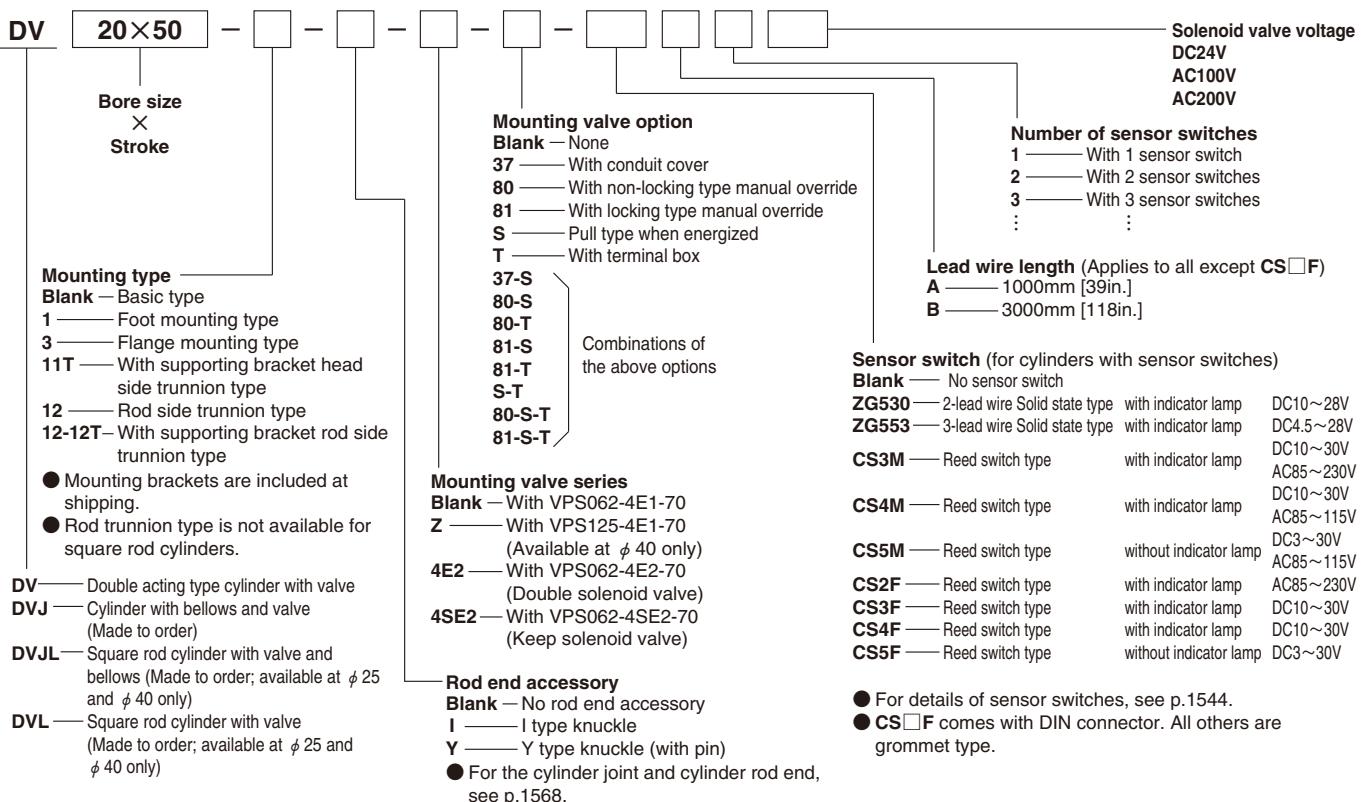

● Points to change for pull type when energized

Remove the nut and washer, pull the valve out from the cylinder, rotate it 180°, and assemble it as before.

Remark: Major parts and materials and seals are the same as for the standard cylinder.

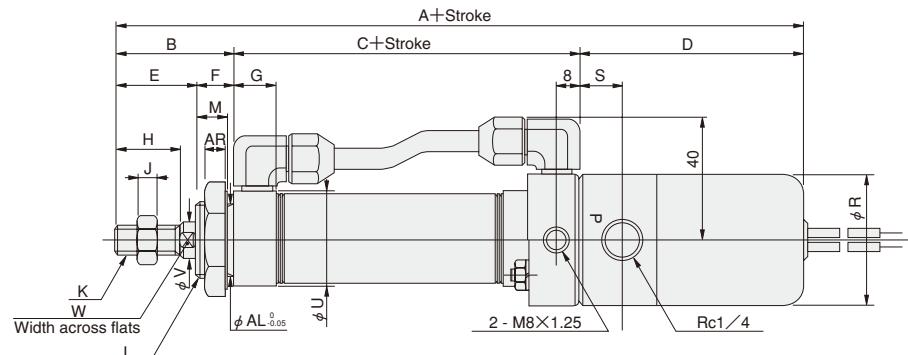

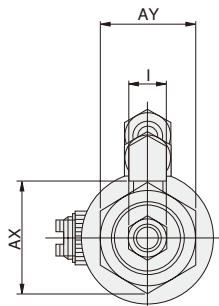

Order Codes

Remarks: 1. Order code for the Valpack valve only is VPS062-4E1-70-voltage (or VPS125-4E1-70-voltage).
2. Can also be manufactured with keep solenoid type (momentarily energizing holding type) valve.

Note: Square rod cylinders are available at ϕ 25 and ϕ 40 only.

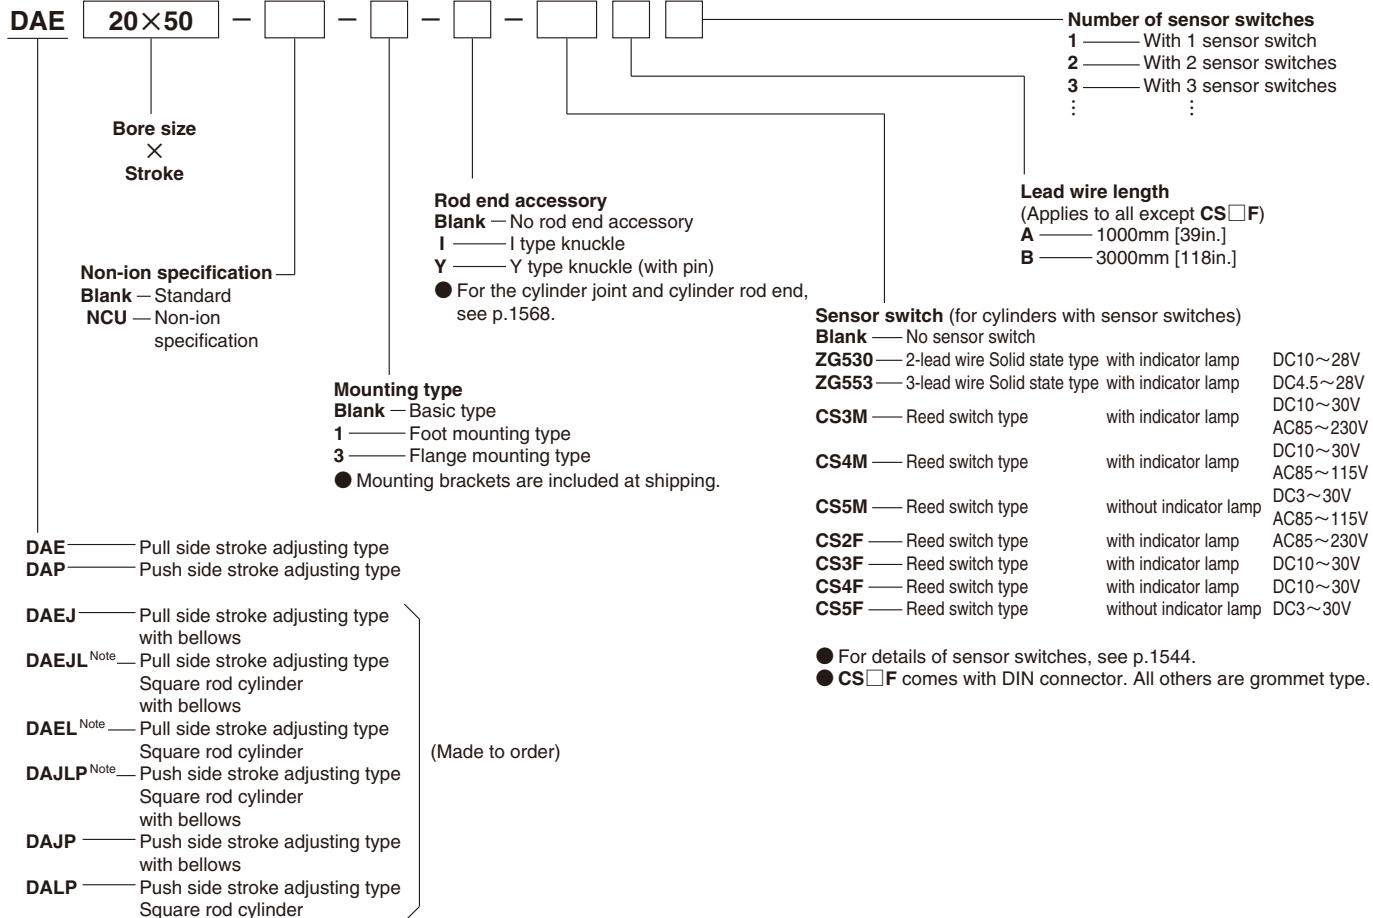

Remarks: 1. Stroke tolerance $+1_0^{+0.039}$ in.]

2. For non-standard strokes, consult us.

3. Figures in parentheses () are for cylinders with bellows.

4. The minimum operating pressure when the stroke is over the maximum stroke is 0.2MPa [29psi].

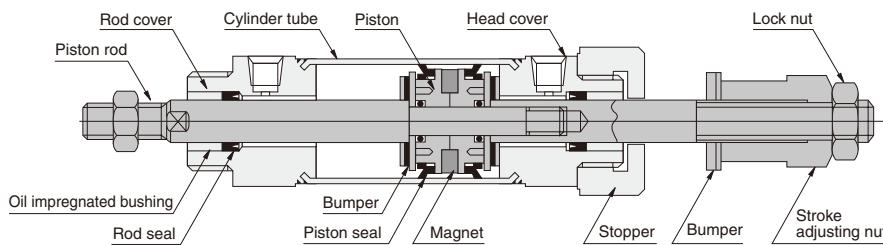

Order Codes

Note: The available bore size is only ϕ 25, 40.

Inner Construction and Major Parts (cannot be disassembled)

● Push side stroke adjusting type

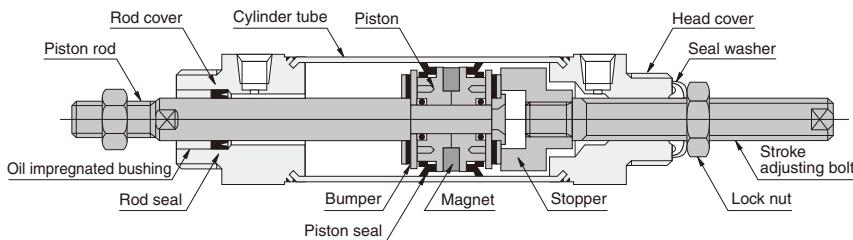

● Instructions for stroke adjustment

For stroke adjustment, turn the stroke adjusting nut. After completing stroke adjustment, secure the stroke adjusting nut in place with a lock nut. If mounting a sensor switch, move the mounting location of the sensor switch along the length of the adjusted stroke.

Note: When re-adjusting the stroke, always use a wrench to loosen the stroke adjusting nut and then complete the adjustment according to the above procedure.

Do not use the method of securing the piston rod in place and then loosen the lock nut.

● Pull side stroke adjusting type

● Instructions for stroke adjustment

For stroke adjustment, turn the stroke adjusting bolt. After completing stroke adjustment, secure the stroke adjusting bolt in place with a lock nut. If mounting a sensor switch, move the mounting location of the sensor switch along the length of the adjusted stroke.

Major Parts and Materials

| Parts | Bore size | 20, 25, 32, 40 |
|---------------|-----------|---|
| Cylinder tube | | Stainless steel |
| Piston | | Plastic |
| Piston rod | | Steel (hard chrome plated) |
| Rod cover | | Aluminum alloy (anodized) |
| Head cover | | |
| Seal | | Synthetic rubber (NBR) |
| Bumper | | |
| Magnet | | Plastic magnet |
| Bellows | | Nylon tarpaulin (heat resistant temperature 70°C [158°F]) |

Seals

Note: Seals cannot be replaced.

Remarks: 1. Stroke tolerance $^{+1}_{-0}$ [$^{+0.039}_{-0}$ in.]
2. For non-standard strokes, consult us.

3. Figures in parentheses [] are for cases when foot mounting brackets are used for mounting.
4. The minimum operating pressure when the stroke is over the maximum stroke at bore size of $\phi 20 \sim \phi 40$ is 0.2MPa [29psi].

Operating Principle

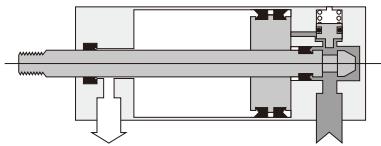

Keep

When the piston reaches the end of the stroke, and the head side is completely exhausted, spring force causes the lock piston to engage, and automatically keep the end of stroke position.

Release

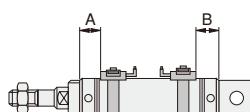

Supplying compressed air to the port on the locking mechanism side pushes up the lock piston and releases the lock. When the lock is released, the by-pass air passage opens to supply compressed air to the piston side.

Mounting Location of Sensor Switch

When the sensor switch is mounted in the location shown in the diagram (figures in the table are reference values), the magnet comes to the sensor switch's maximum sensing location at the end of the stroke.

Notes: 1. The body is for common use. For details, see the Handling Instructions and Precautions on p.369.

2. Do not use lubrication.

3. For the case where cylinder speed is 300mm [11.8in./sec.], pressure is 0.5MPa [73psi.], and the load ratio is 25%. For details, see the Handling Instructions and Precautions on p.369.

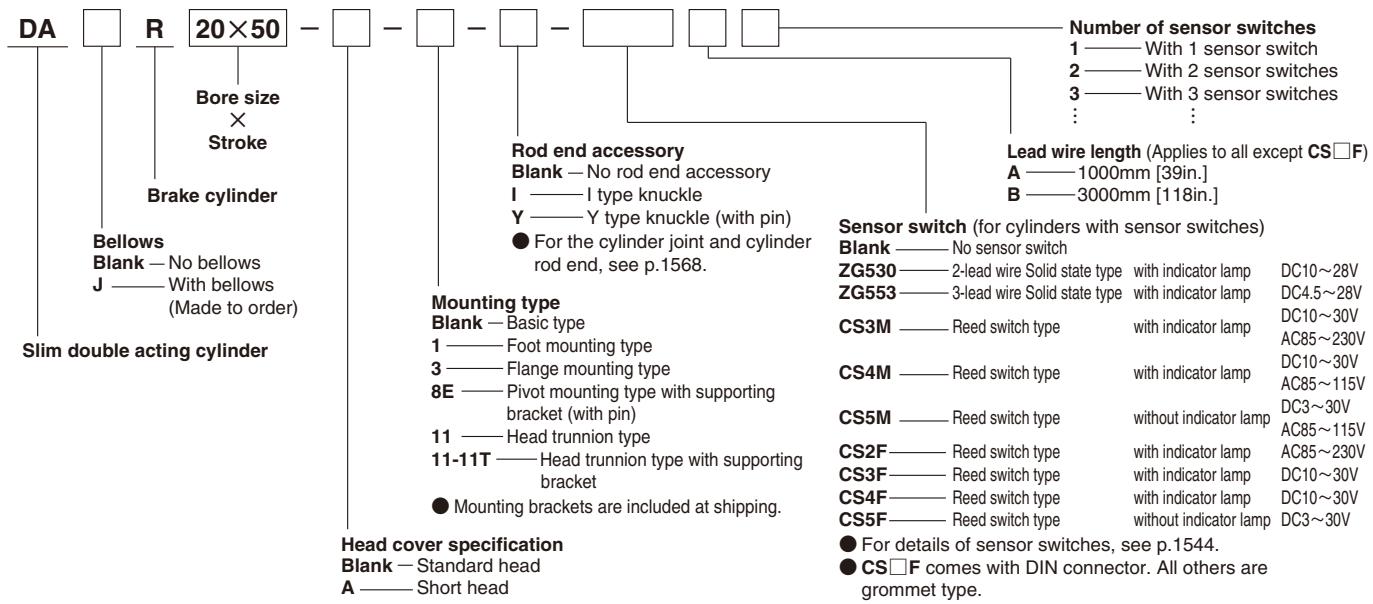

Bore Size and Strokes

Major Parts and Materials

| No. | Parts | Materials |
|-----|---------------------|---|
| ① | Cylinder tube | Stainless steel |
| ② | Piston | Plastic |
| ③ | Piston rod | Steel (hard chrome plated) |
| ④ | Rod cover | |
| ⑤ | Head cover | Aluminum (anodized) |
| ⑥ | Piston seal | |
| ⑦~⑨ | Rod seal | Synthetic rubber (NBR) |
| ⑩~⑬ | O-ring | |
| ⑭ | Bumper | |
| ⑮ | Magnet | Plastic magnet |
| ⑯ | Rod bushing | Oil impregnated bronze sintered alloy |
| ⑰ | Brake head | Aluminum (anodized) |
| ⑱ | Brake piston | Special steel (heat-treated) |
| ⑲ | Collet | |
| ⑳ | Steel ball | High carbon steel |
| ㉑ | Brake shoe | Special brake lining (copper sintered material) |
| ㉒ | Brake shoe holder | Special steel (heat-treated) |
| ㉓ | Holder | |
| ㉔ | Guide | Aluminum alloy |
| ㉕ | Spring | Piano wire (zinc plated) |
| ㉖~㉗ | Wear ring | Plastic |
| ㉘ | Brake release screw | Mild steel (zinc plated) |
| | Bellows | Nylon tarpaulin (heat resistant temperature 60°C) |

Operation of Dual Stroke Cylinders

Dual Stroke Cylinders are a set of 2 cylinders connected back to back.

The cylinder body can be secured in place and each stroke can be controlled separately. It can also be used to obtain 2-stage or 3-stage strokes by securing the piston rod on one side in place.

OPTIONAL ROD END SHAPE PATTERNS

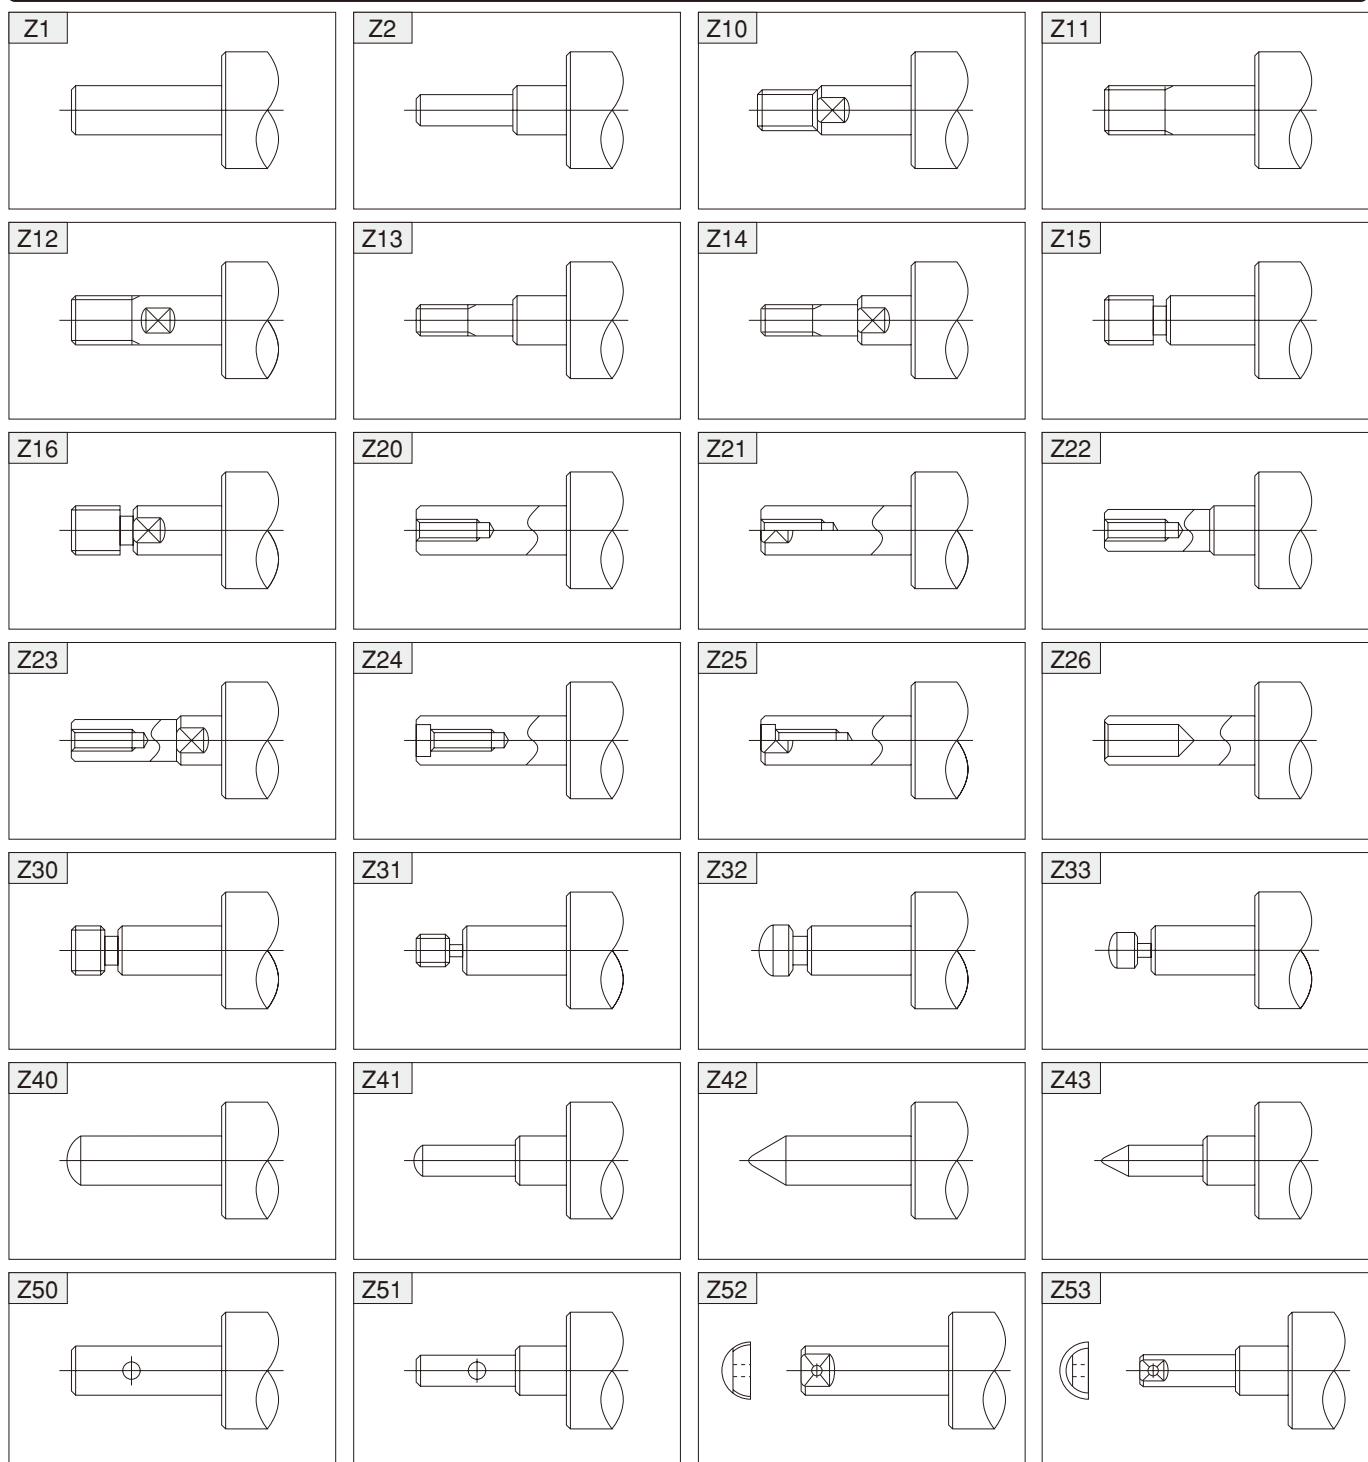

Use an order form of rod end pattern and fill the items on the selected one from among 28 types of optional patterned shapes to obtain made-to-order cylinders of non-standard rod end shapes.

The shapes can be applied to the entire Slim cylinders series with the exception of square rod cylinders and cylinders with bellows. For the order form containing the optional patterned shapes, consult us.

SENSOR SWITCHES

Solid State Type, Reed Switch Type

- Since a magnet is already standard on the Slim cylinders series^{Note}, mounting a sensor switch will enable use in sensor switch applications.

Sensor Switch Operating Range, Response Differential, and Maximum Sensing Location

● Operating range : ℓ

The distance the piston travels in one direction, while the switch is in the ON position.

● Response differential : C

The distance between the point where the piston turns the switch ON and the point where the switch is turned OFF as the piston travels in the opposite direction.

Moving Sensor Switch

● ZG530□
ZG553□
CS□M

- Loosening the mounting screw allows the sensor switch to be moved freely along with the strap in the axial and circumferential direction. The sensor switch alone cannot be moved.
- To remove the sensor switch from the strap, first detach the strap from the cylinder tube and then remove the sensor switch from the strap.
- Tighten the mounting screw with a tightening torque of 49N·cm [4.3in-lbf].

● CS□F

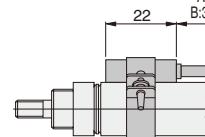

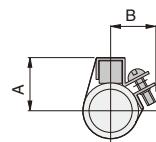

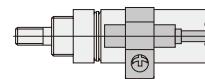

- Loosening the mounting screw allows the sensor switch to be moved freely in the axial and circumferential direction.
 - Slightly loosening the mounting screw allows fine adjustment of the lead switch only, up to 5mm [0.2in.] in the axial direction.
- Tighten the mounting screw with a tightening torque of 68.6N·cm [6.1in-lbf].

Note: Figures in parentheses () are for the cylinder with variable cushion.

Order Codes for Mounting Bracket

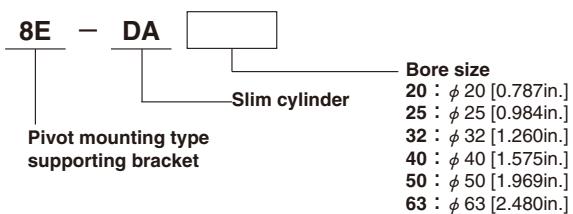

(1) Foot mounting bracket

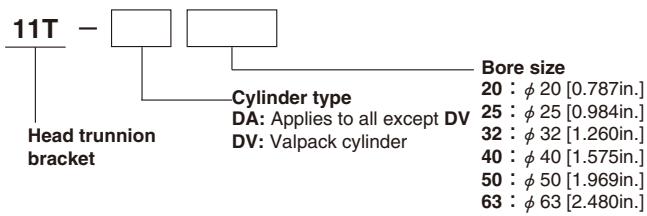

(2) Flange mounting bracket

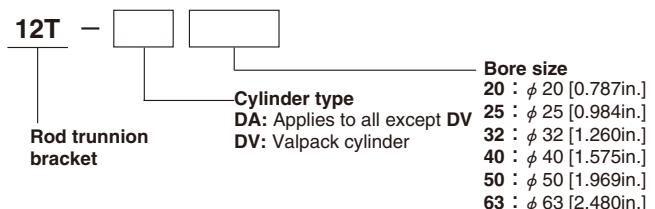

(3) Pivot mounting type supporting bracket

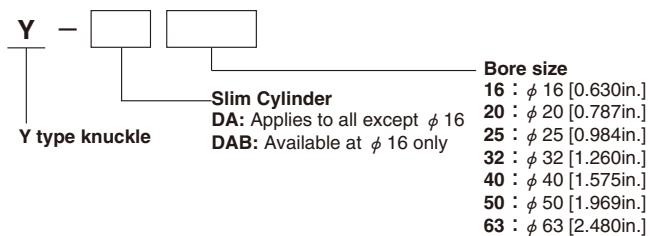

(4) Head trunnion bracket

(5) Rod trunnion bracket

(6) Y type knuckle

(7) I type knuckle
