# Koganei Clean System products provide complete support for the maintenance of a clean environment inside the cleanroom. 

Koganei Clean System products meet the needs of the ultra-clean production environment. In everything from actuators and valves to air preparation and auxiliary equipment, anti-corrosion materials processing and other Koganei-developed design concepts serve to prevent particle contamination within the cleanroom. These perfectly designed mechanisms, which resolve even the slightest leaks to the outside during operations, have already won a high level of reliability.

## Koganei Cleanliness

There is currently no standard in JIS or elsewhere for methods of evaluating cleanliness for pneumatic equipment in the cleanroom specifications. Therefore, to measure the effects of cleanroom contamination by pneumatic equipment, Koganei has decided to use "number of particles generated per 10 operations," rather than particle density. Koganei has also developed classifications for application classes in cleanroom, based on JIS and other upper limit density tables, and on the company's own experience.

Remarks: 1. In the above table, product performance in terms of the number of particles generated per 10 operations is expressed as the upper limit of particles corresponding to the equivalent JIS or ISO class.
2. In the above table, values in the JIS, ISO, and FED-STD upper limit density tables are calculated as upper density per liter.
3. The classes shown are clean levels as classified in JIS and ISO.

From the above definitions, the Koganei clean level classes can be viewed as the level of average contamination per liter of surrounding air over a period of 10 operations in cleanroom. Air ventilation in cleanrooms is usually faster than 1 cycle per minute, and clean volumetric capacity is usually larger than 1 liter, which should provide a sufficient safety margin in practice.

Caution: The above conclusions are based on an ideal situation in which air ventilation is being implemented. For specific cases where air ventilation is not ensured, caution is needed since the clean classes cannot be maintained.

The clean system diagrams shown here are for Class 5 equivalent products. For Class 4 or Class 3 equivalent products, consult us.

## Evaluations of Cleanliness

Koganei has therefore specified its in-house measurement methods, to conduct evaluations on the cleanroom rating.

The number of particles of the Air Cylinder Cleanroom Specification is measured as shown in the method below.

## 1. Measurement conditions

1-1 Test circuit: Figure 1 (no suction), Figure 2 (with suction)

1-2 Operating conditions of tested cylinder
Operating frequency: 1 Hz
Average speed: $500 \mathrm{~mm} / \mathrm{s}$ [20in. $/ \mathrm{sec}$.]
Applied pressure: 0.5 MPa [73psi.]
Suction condition: Microejector ME05, Primary side: 0.5 MPa [73psi.] applied, Tube: $\phi 6$ [0.236in.]
Mounting direction: Vertical
Chamber volume: $8.3 \ell$ [0.293 $\mathrm{ft}{ }^{3}$ ]

## 2. Particle counter

Manufacturer/model: RION/KM20
Suction flow rate: $28.3 \mathrm{l} / \mathrm{min}$ [ 1 ft . $/ \mathrm{min}$.]
Particle diameter: $0.1 \mu \mathrm{~m}, 0.2 \mu \mathrm{~m}, 0.3 \mu \mathrm{~m}, 0.5 \mu \mathrm{~m}, 0.7 \mu \mathrm{~m}, 1.0 \mu \mathrm{~m}$

## 3. Measurement method

3-1 Confirmation of number of particles in the measurement system
Under the conditions in the above 1 and 2 , using a particle counter to measure the sample for 9 minutes without operating the measurement sample, and confirmed the measured number of particle is 1 piece or less.
3-2 Measurement under operation
Under the conditions in the above1 and 2, operating the measurement sample for 36 minutes, and measured the total values in the latter half of 18 minutes test.
3-3 Reconfirmation
Performed the measurement in 3-1 again, to reconfirm the number of particles in the measurement system.

## 4. Measurement results

- Cleanroom specification

Jig Cylinder (no suction from dust collection port)
Particle generation over 1 million operations (CS-CDA16×30)

- Cleanroom specification

Slim Cylinder (with suction from dust collection port)
Particle generation over 1 million operations (CS-DA20×100)

For "safety precautions" listed in the Clean System Product Drawings, see the materials below.

- For actuators, see "Safety Precautions" on p. 45 of the Actuators General Catalog .
- For valves, see "Safety Precautions" on p. 31 of the Valves General Catalog.
- For air treatment and auxiliary equipment, see "Safety Precautions" on p. 31 of the General Catalog of Air Treatment, Auxiliary, Vacuum.

## Sensor Switch Operating Range, Response Differential, and Maximum Sensing Location

- Operating range : $\ell$

The distance the piston travels in one direction, while the switch is in the ON position.

- Response differential : C

The distance between the point where the piston turns the switch ON and the point where the switch is turned OFF as the piston travels in the opposite direction.

## Moving Sensor Switch

OZG530
ZG553
CS $\square \mathbf{M}$

- Loosening the mounting screw allows the sensor switch to be moved freely along with the strap in the axial and circumferential direction. The sensor switch alone cannot be moved.
- To remove the sensor switch from the strap, first detach the strap from the cylinder tube and then remove the sensor switch from the strap.
- Tighten the mounting screw with a tightening torque of $49 \mathrm{~N} \cdot \mathrm{~cm}$ [4.3in•lbf] or less.

## CS $\square \mathrm{F}$

Loosening the mounting screw allows the sensor switch to be moved freely in the axial and circumferential direction.

- Slightly loosening the mounting screw allows fine adjustment of the lead switch only, up to 5 mm [0.197in.] in the axial direction. Tighten the mounting screw with a tightening torque of $68.6 \mathrm{~N} \cdot \mathrm{~cm}$ [6.1in $\cdot \mathrm{lbf}$ ] or less.

Dimensions of Sensor Switch mm [in.]

[^0]:    For the order codes of additional parts, see p. 64.

[^1]:    Calculation example: For head side end keep side mount type of 32 mm bore size and 100 mm stroke, $500+(1.5 \times 100)=650 \mathrm{~g}$ [22.93 oz.]
